

Learning Reflection

Completing these four modules helped me understand the basic process of Android application development. Before starting the training, I had some basic programming knowledge, but I was not very familiar with developing Android applications using Kotlin and Jetpack Compose.

The first and fourth modules helped me improve my Kotlin programming skills. I learned that it is important to understand the basic programming concepts before trying to create a complete mobile application. Practicing the code in Kotlin Playground was especially useful because I could test small programs and immediately see the results.

The Android Studio module helped me understand the development environment. I learned that Android development is not only about writing Kotlin code. I also need to understand how the development tools and project structure work. This gave me a better idea of how an Android project is created and tested.

The basic layout module was interesting because I could see my code being used to create an actual user interface. Jetpack Compose helped me understand the connection between Kotlin code and the visual part of an application. When I changed the code, I could see changes in the application layout.

One challenge I experienced was getting used to new Kotlin syntax and the Android development environment. Some parts were confusing when I first started. I solved this by following the Android Developers examples step by step, running the code, and checking the results. Repeating the exercises helped me understand the concepts instead of only copying the examples.

Overall, these modules gave me a stronger foundation for mobile application development. I now understand that Kotlin programming, Android Studio, and Jetpack Compose are connected parts of Android development. I still need more practice with advanced Android features, but these modules have made me more confident about continuing my learning.
